Subject: Stock Ownership and Stock Price Expectations

From: Joanne Hsu, PhD, Director
Ownership of stocks, including directly held assets as well as assets held in mutual funds and retirement accounts, rose to an average of $69 \%$ of all households in 2022 , up from $66 \%$ in 2018 (see table on next page, left panel). The persistence of high prices means that inflation adjusted returns on interest-bearing financial accounts continue to be negative, which supports continued stock market participation in spite of the considerable declines in major stock market indices since their highs in late 2021. The sharpest increases in stock market participation rates were found among the lower tercile of households by income, which is

October 21, 2022

## Probability of Stock Price Increase

 unsurprising given the growing accessibility of low-cost direct investing in recent years. In contrast, stock ownership rates are little changed for higher income households, which were already elevated relative to other groups. Overall, a growing share of consumers are exposed to fluctuations in the stock market.

The median value of equities held by stock market participants rose to about $\$ 148,000$ in 2021Q4 from $\$ 100,000$ in 2017Q4, a $45 \%$ increase that was similar in magnitude to growth in the Dow Jones Industrial Average over this time period (see table, middle panel). Given that stock market indices have since declined substantially over the course of 2022, preliminary data for the $4^{\text {th }}$ quarter of this year is also displayed in the table. The most recent data show a $20 \%$ decline in median stock holdings over the last four quarters. While higher income households have larger holdings, they also experienced steeper proportional declines in the value of their holdings since 2021. Households in all quintiles of stock holdings saw lower values in 2022Q4 relative to 2021Q4 as well, ranging from $19 \%$ to $34 \%$ declines in their holdings. In fact, for most demographic groups, the current values of holdings are even lower than five years ago.

Concurrently with this decline in the value of holdings, consumer expectations for stock market performance deteriorated as well. The probability of stock price gain in the year ahead reported by stock owners has fallen continuously since the fourth quarter of 2021 when it reached $62 \%$ (see chart and right panel of the table). The current reading is now less than $44 \%$, the lowest since 2012. Unlike the previous few years, those with stock holdings exceeding $\$ 100,000$ are no more optimistic about future stock price gains than stock owners overall. The last time a decline of this size and speed was observed in the data was just prior to the Great Recession, in the four quarters following 2007Q3. While this comparison does not necessarily imply that stock owners expect a financial crisis, there is considerable uncertainty going forward regarding various factors affecting financial markets. For example, consumers broadly expect continued interest rate hikes by the Federal Reserve, but it remains to be seen how aggressive the Fed will be, and whether the Fed, along with central banks around the world, can engineer relatively soft landings without ushering in painful recessions, particularly with numerous global factors at play.

This uncertainty is reflected in the considerable turbulence in financial markets this year, which in turn have also influenced consumer sentiment. Higher-income stock holders currently have lower expectations of stock price gains, and larger recent declines in the value of their holdings, than lower-income individuals, which mirrors sentiment: in the most recent reading, the top tercile of income had lower sentiment than the lowest tercile, in contrast to the more typical pattern where higher incomes are associated with more favorable sentiment. Given that higher-income consumers are responsible for a disproportionate share of spending, continued tightening by the Fed could generate a notable negative wealth effect on spending. Older stock owners age 65 and older have the lowest stock price expectations, and given their sizable holdings and the $30 \%$ declines they have already seen this year, any continued deterioration in financial markets could have an impact on their living standards and spending plans in retirement.

Table: Stock Ownership Rates, Value of Stock Holdings, and Probability of Gains in Stock Prices
